

* Remember you will also have to run your CO₂ line into an inlet on your powerhead if available, or make another

hole in your bottle, about 1/2 way down & push the tube far enough into the bottle that the CO₂ is released into water flow

Powerhead forces water into bottle dissolving CO₂, undissolved CO₂ rises to the top & gets recycled into water flow until dissolved. The bottle serves to contain the CO₂ until it dissolves completely

→ water flows out to aquarium
